

ABSTRACT

The present novel material, an adjuvant for accelating enzyme activity, is manufactured by contacting with organic substances and/or orgnic compounds included a small quantity of inorganic substances and catlizers including enzymes in nature, clay catalizer, microorganism group and water, and closely resembles to maternal amniotic liquid contained 15 kinds of specific metallic cation, which are indispensable material to activate the enzymes, and 20 kinds of low molecular organic compound contained indispensable basic amino acids, which is necessary to supply the biological components.

The novel material, accordingly, provides many functions which decompose and digest away the living or business refuses, comprising organic substances and /or organic compounds, and which protect and recover the bioorganisms and their damages, just same as the functions of the maternal amniotic liquid.
